1. Claims 1-26 are allowed.
2. The following is an examiner's statement of reasons for allowance: an audio data decoded in an MPEG system to be stored in a storage unit is supplied to an audio output via a filtering processing. For performing the filtering processing, presentation time interval of respective audio data is changed to conform to a user's designated playback speed, and the decoded audio data stored in the storage unit by being synchronized with the changed presentation time interval is written on an input queue in the set unit.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Bland discloses a method and system for sampling rate conversion in digital audio applications. The method includes receiving a first digital audio signal including samples and having a first sampling rate. The method also includes outputting at least one sample from the first digital audio signal as part of a second digital audio signal, the second digital audio signal having a desired second sampling rate, the second sampling rate being higher than the first sampling rate. The method also includes incrementing a counter for each sample from the first digital audio signal that is output as part of the second digital audio signal. data X, generates input packets by adding generation numbers and node numbers indicative of prescribed destinations, in the order of reception, and in addition, generates a data packet from a separately input clock signal. The input data packet is written to an image memory using the generation number in the packet as an address signal, or read from the image memory using the generation number in the data packet as an address signal.
